(October 1998 version). The genomic sequence was searched against NVBI NonRedutant Protein database, nr (ftp://ncbi.nlm.nih.gov/blast/db) and the cDNA sequence database at RGP. Protein homologies of the coding regions were searched against RGP. Protein homologies of the coding regions were searched against the identified cDNA sequences using BLASTN 2.0 with the corresponding DDBJ accession no. and RGP clone ID.

A gene with identity or significant homology to a protein is classified based on the protein name to indicate the homology level such as same name, 'putative' and 'like protein'. A gene without almost the entire length of partial sequence) is classified as an 'unknown' protein. A gene predicted with a gene prediction program is classified as a 'hypothetical' protein.

The orientation of the sequence is from SP6 to T7 of the PAC clone. This sequence of P0001B06 clone has an overlap with P0671B11.

DebbJ:AP002746 ) clone at the position 10 61357 of 5' end. The sequence of this clone starts at the position 107016 of P0671B11.

Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp.dna.affrc.go.jp/GenomeSeq.html Detailed information on overlap and assembly quality together with annotation of this entry is available at http://rgp dna.affrc.go.jp/GenomeSeq.html.

On Sep 7, 2000 this sequence version replaced gi:9049479.
Genes were predicted from the integrated results of the following:
GENSCANI.0, BLASTNZ.0 as well as SplicePredictor
(October 1998 version). The genomic sequence was searched against
NCDI NonReduntant Protein database, nr
(ftp://ncbi.nlm.ni.gov/blast/db) and the cDNA sequence database at
RGP. Protein homologies of the coding regions were searched against
NCBI NonReduntant Protein database with BLASTPO.0. ESTS represent
the identified cDNA sequences using BLASTP 2.0 atthe the
corresponding DDBJ accession no. and RGP clone ID.
A gene with identity or significant homology to a protein is
significant homology to any protein name to indicate the homology (covering
almost the entire length) is classified as an 'unknown' protein. A
gene predicted with a gene prediction program is classified as a
"hypothetical' protein."

"hypothetical' protein."

"hypothetical' protein as seame prediction program is classified as a

                                                                            or EST similarity are named as unknown proteins. Genes without protein or EST similarity, that are predicted by more than two gene prediction programs over most of their length are annotated as thypothetical proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, http://genome.wustl.edu/eddy/tRNAscan-SE/). Simple repeats are identified by repeatmasker (Arian Smit, http://ftp.genome.washington.edu/RM/Repeatmasker.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /product-"hypothetical protein; 887-1915"

                                                                                                                                gene NPR1. It may be used in the production of transgenic cells which can produce the encoded acquired resistance protein. Such transgenic plant cells are useful in the production of plants having an increased level of resistance against disease caused by plant pathogens, e.g. bacteria, mycoplasmas, fungi, insects, nematodes, viruses, and viroids.

                and their coding sequences from Arabidopsis thalians, Brassica napus, Nicotiana tabacum, Lycopersicon esculentum, Beta vulgaris, Helianthus annus and Solanum tuberosum. NIM1 is one of the proteins involved in the signal transduction cascade leading to systemic acquired resistance (SAR) in plants. This gives the plants an increased resistance to disease. The gene and protein can be used to produce transgenic plants resistant to diseases caused by viruses, such as tobacco or cucumber mosaic virus, ringspot virus, pelargonium leaf curl virus, red clover mottle virus, tomato bushy stunt virus, fungi, including Phythophthora parasitica and Peronospora tabacina, bacteria such as secudomonas syringae and Peabach, insects, including aphids and lepidoptera and nematodes such as Meloidogyne incognita. In particular they can be used against disease
present invention is concerned with the isolation of NIM1 homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    419
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            180

The present invention is concerned with the isolation of NIMI homologues and their coding sequences from Arabidopsis thaliana, Brassica napus, Micotiana tabacum, Lycopersicon esculentum, Beta vulgaris, Helianthus annuus and Solanum tuberosum. NIMI is one of the proteins involved in the signal transduction cascade leading to systemic acquired resistance (SAR) in plants. This gives the plants an increased resistance to disease. The gene and protein can be used to produce transgenic plants resistant to diseases caused by viruses, such as tobacco or cucumber mosaic virus, ringspot virus, pelargonium leaf curl virus, red clover mottle virus, remato bushy stuft virus, fungi, including Phythophthora parasitica and Peronospora tabacina, bacteria such as Pseudomonas syringae and P. tabacii, insects, including aphids and lepidoptera and nematodes such as Meloidogyne incognita. In particular they can be used against disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            426

nover plant genes for enhancing systemic acquired resistance gene expression and broad spectrum disease resistance in plants, are homelogines of harbidocals with a second panes. homologues of Arabidopsis NIM1 gene -

Claim 3; Page 127-130; 152pp; English.

The present invention is concerned with the isolation of NIMI homologues and their coding sequences from Arabidopsis thaliana, Brassica napus, Nicotiana tabacum, Lycopersicon esculentum, Beta vulgaris, Halianthus annuus and Solanum tuberosum. NIMI is one of the proteins involved in the signal transduction cascade leading to systemic acquired resistance (SAR) in plants. This gives the plants an increased resistance to disease. The gene and protein can be used to produce transgenic plants resistant to diseases caused by viruses, such as tobacco or cucumber mosaic virus, ringspot virus, pelargonium leaf curl virus, red clover mottle virus, tomato bushy stunt virus, fungi, including Phythophthora parasitica and Peronospora tabacina, bacteria such as Pseudomonas syringae and P. tabaci, insects, including aphids and lepidoptera and nematodes such as Mallidgagne incognita. In particular they can be used against disease organisms of maize.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention is concerned with the isolation of NIMI homologues and their coding sequences from Arabidopsis thaliana, Brassica napus, Nicotiana tabacum, Lycopersicon esculentum, Beta vulgaris, Helianthus annous and Solanum tubercoum. NIMI is one of the proteins involved in the signal transduction cascade leading to systemic acquired resistance (SAR) in plants. This gives the plants an increased resistance to disease. The gene and protein can be used to produce transgenic plants resistant to diseases caused by viruses, such as tobacco or cucumber mosaic virus, tringspot virus, pelargonium leaf curl virus, red clover mottle virus, tomato bushy stunt virus, fungi, including Phythophthora parasitica and Peronospora tabacina, bacteria such as Beaudomonas syringae and predidionation in particular they can be used against disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

It may be used in the production of transgenic cells which can produce the enco acquired resistance protein. Such transgenic plants cells are useful in the production of plants having an increased level of resistance against disease caused by plant pathogens, e.g. bacteria, mycoplasmas, fungi, insects, nematodes, viruses, and viroids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CGGAGITIGACTACTTCGCCGACGCTAAGCTTGTGGTTTCCGGCCCGTGTAAGGAAATTC 474

This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and namarodes. The method provides a high level of resistance and allows a reduction in the amount of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to

This sequence encodes a variant NIM-1 protein from Arabidopsis thaliana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first lead of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method provides a high level of resistance and allows a reduction in the amount of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           816

Inducible immunity-1 (NIM) protein. Sequences shown in AAV43661 to
AAV43665 represent variants of the NIM1 CDNA. The invention provides a
chimeric gene comprising a promoter active in plants operatively linked
to a DNA molecule that encodes an altered form of the NIM1 protein. Plant
cells stably transformed with a recombinant vector comprising such a
chimeric gene have a broad spectrum of disease resistance. The altered
chimeric gene have a broad spectrum of disease resistance. The altered
chimeric gene have a broad spectrum of disease resistance. The altered
chimeric gene have a broad spectrum of disease resistance.
CC chimeric gene have a broad spectrum of disease resistance.
CC acquired resistance (SAR) signal transduction pathway. The transgenic
plants transformed with an altered NIM1 gene exhibits constitutive SAR
expression which is higher in the transformed plants than in a wild-type
plants. The products can be used for producing plants with a broad
compounds that induce constitutive immunity (CIM) phenotype
in plants. The inventions can be used with plants such as rice, wheat,
barley, rye, corn, potato, carrot, sweet potato, sugar beet, bean, pea,
chicory, lettuce, cabbage, cauliflower, broccoli, turnip, radish,
spinach, asparagus, onion, garlic, eggplant, pepper, celery, carrot,
squash, pumpkin, zucchini, cucumber, apple, pear, quince, melon, plum,
cherry, peach, nectarine, apricot, strawberry, grape, raspberry,
blackberry, pineapple, avocado, papaya, mango, banana, soybean, tobacco,
                                                                                                                      Non-inducible immunity-1 gene; NIM1 gene; disease resistance; mutant; transgenic plant; SAR; systemic acquired resistance; CIM; pathogen; constitutive immunity; agriculture; variant; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of non-inducible immunity-1 gene - for transforming plants to produce transgenic plants having a broad spectrum disease resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This cDNA encodes an altered form of the Arabidopsis thaliana non
                                                                                   Non-inducible immunity-1 (NIM1) protein variant 1 encoding cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Steiner HY;

                                                                                                                                                                                                                                                                                          The present invention is concerned with the isolation of NIMI homologues and their coding sequences from Arabidopsis thaliana, Brassica napus, Nicotiana tabacum. Lycopersicon esculentum, Beta vulgaris, Hellanthus annuus and Solanum tuberosum. NIMI is one of the proteins involved in the signal transduction cascade leading to systemic acquired resistance (SAR) in plants. This gives the plants an increased resistance to disease. The
                                                                                                                                                                                                                                                                                                                                                                                gene and protein can be used to produce transgenic plants resistant to diseases caused by viruses, such as tobacco or cucumber mosaic virus, ringspot virus, pelargonium leaf curl virus, red clover mottle virus, tomato bushy stunt virus, fungi, including Phythophthora parasitica and Peronospora tabacina, bacteria such as Pseudomonas syringae and Perabaci, insects, including aphids and lepidoptera and nematodes such as Meloidogyne incognita. In particular they can be used against disease

The invention relates to rice proteins (AAB29749-B29757) and the nucleotides encoding the proteins (AAC81456-C81464), which are involved in the induction of systemic acquired resistance (SAR), a general plant resistance response that can be induced during a local infection by an avirulent pathogen. A rice cDNA library was screened using the yeast two hybrid system with Arabidopsis NRP1 cDNA as bait, and the rice proteins that (proline rich NPR1 interactor; AAB29749) and MN1 (AAB29758) were identified as interacting with Arabidopsis NRP1. The rice cDNA library was then rescreened using rice PNI cDNA or rice MN1 (CDNA as bait, Rice NH1 and NH2 (NPR homologues I and 2; AAB29753), and a protein with no protein (AAB29754) were identified as interacting with PNI protein and rice GRLI and GRLI (glutaredoxin homologues I and 2; AAB29755, AAB29755) and rice MADA1 (a protein with homology to rat microtubule-associated protein; AAB29757) were found to interact with a microtubule-associated protein; AAB29757) were found to interact with a screet of the control of the invention additionally encompasses transgenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plants comprising an expression cassette encoding a protein of the invention, and a method for enhancing resistance to pathogens in a plant by introducing the expression cassette into the plant, and selecting the plant with enhanced resistance. The rice SAR-associated nucleic acids and proteins are useful for enhancing plant resistance to pathogens such as viruses, bacteria, nematodes, fungi or insects. The present sequence represents cDNA encoding rice NH1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rice; NH1; NPR1 homologue 1; PNI interactor; SAR; bZIP protein;

```
The present sequence is a putative version of the rice negatively phytochrome regulated 1 (NPR1) gene coding sequence. It was isolated by screening a leaf cDNA library for those sequences which were similar to the NPR1 gene from Arabidopsis thaliana. The protein is involved in systemic acquired resistance and this gene can be used to create transgenic plants which are protected from pathogens. It can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated nucleic acid fragments encoding an NPRI gene which can be used to transform plants and provide disease resistance

```

This sequence encodes a truncated variant NIW-1 protein from Arabidopsis thaliana. This protein is used in a method resulting in the protection of an immunomodulated plant having a first level of resistance and involves treatment with at least 1 microbicide that confers a second level of resistance, such that the plants have a third level of resistance greater than the sum of the first two levels. The method can be applied to a wide variety of plants (cereals, fruits, oilseeds, vegetables etc.) to protect against viruses, fungi, bacteria, insects and nematodes. The method provides a high level of resistance and allows a reduction in the amount of micobicide used. Since the process involves two different methods of protection, it is unlikely that the pathogen will develop resistance to
